Dear Mr Ivan Gergel,

94 404 citalopram vs placebo in the treatment of adolescent depression have been unblinded and unfortunately with a negative result. It was not possible to detect a significant difference between the two treatment groups.

However the statisticians will look further in to the data concerning, among other things, the dose level as it appears that a relatively large quantity of patients remained on 10 maybe 20 mg of study medication. Additionally there might be a substantial center effect, both with respect to efficacy measures and withdrawals. Finally the time periods at which the patients have been recruited may also have influenced the results.

We have not have the time to look in to the safety data just yet, but if you wish Per Tanghøj will forward them to you as I will be away on vacation.

The headline results will be send to you by courier today, if you wish for a fax copy let either me or Per Tanghøj know which fax number we should use.

KH/Best regards,
